Nishaan

Every printed copy of a question paper is a witness.

Har copy, ek gawah

NEET-UG 2026 was cancelled for over 22 lakh students because nobody could say where the leaked paper came from. Nishaan names the source in seconds.

A photo of any piece of a leaked page

Torn, crumpled, booklet number covered. Each copy shifts every word and line by about 0.12 mm in a pattern secret to that booklet.

Names the booklet, centre, room, seat, press and invigilator.

A retyped guess paper

Retyping wipes every serial, so each moderator, translator and centre gets its own meaning-preserving wording and option order.

Names the holder or centre it came from, or the stage it leaked at.

Same line, two booklets

Shifts drawn 3 times larger than printed. A slanted link = a moved word.

How it works

1 Issue

The paper is typeset once per booklet. Every soft copy and centre gets its own canary wording and answer key.

2 Trace

A phone photo is aligned to the master page, every word measured to a fraction of a pixel and correlated against every issued booklet.

3 Prove

Every hand-over and every trace is sealed in a SHA-256 hash chain. Each verdict shows its evidence, not a black-box score.

28 of 30
simulated phone photos traced to the right booklet, none to a wrong one

20 of 20
retyped leaks traced to the right holder

1 to 2 s
per trace on a laptop CPU

0
special ink, printers or apps needed

Fits the system India already runs

Booklets already carry unique serials; Nishaan spreads that serial across every line. It plugs into the encrypted print-at-centre model (CPPT) recommended by the Radhakrishnan committee, and runs offline on one laptop.

Built with

Python, FastAPI, OpenCV (SIFT, homography, sub-pixel matching), NumPy, ReportLab, PyMuPDF, RapidFuzz, SQLite, plain JavaScript.

Sources: The News Minute and Scroll (NEET-UG 2026, May 2026); LiveLaw and Wikipedia (NEET 2024 serial trace); SuperKalam (CPPT). Accuracy figures come from simulated phone photos and retyped leaks generated from the demo exam.
